her/ai demo reels: skill brief and scripts

> **For Krissty:** This is the complete brief for the script-writing part of the social media skill. It replaces the earlier `demo-script-guide.md` and `example-scripts.md`.

- **Part 1** holds the rules. It belongs in the skill as `references/demo-reels-brief.md`, and SKILL.md should read it before writing any script.
- **Part 2** has ten finished scripts. They are the reference examples, and they are also the first batch to produce.
- Start your first test run with **Script 1** (memory).

Part 1: How the skill builds a script

Why these reels exist

her/ai's mission is AI literacy. When people understand what AI actually is, they stop treating it as magic or as a threat. They see it as a tool and use it with nuance and agency.

Every reel shows **one demo, one limitation and one message**, live on screen, in **40 seconds at most**. The viewer gets an "oh, *that's* why" moment and can copy the demo at home the same evening. Every reel is also a teaser for the her/ai workshops and webinars.

Content pillar: **practical education**. No hype and no doom.

The mental model every reel reinforces

> **An AI system = a large language model (the brain, baked once) + a harness (the tools around it: memory, web search, code, research) + an interface (the app).**

Most surprising AI behaviour is explained by which of these three parts is doing the work. The screen shows the behaviour, and the voice-over names the part responsible.

What makes a good demo

A demo idea only qualifies if it passes all five tests:

1. **One message.** It fits in one sentence.
2. **It happens live.** The tool really does it on screen, and nothing is mocked up.
3. **It reveals a limitation or a mechanism.** For example: prediction rather than knowledge, the model vs. its tools, the training cut-off, bias, or following your framing.
4. **Viewers can copy it tonight** with the named tool, at most after changing one setting.
5. **It fits in 40 seconds**, including the time spent waiting for the AI.

Newer models sometimes pass old demos, so **every demo gets a test run before it is scripted.**

Inputs the skill asks for

The skill asks in one message, and only for what's missing:

1. Which demo: what gets typed, and what should happen?
2. Which tool, and which model or setting?
3. What is the one message?
4. Which background colour: orange, light green or dark green?

Then it writes the script and **shows it to Saskia for approval before recording.**

The six beats

Beat	**Time**	**Job**
Hook	0–4s	A claim that challenges an assumption, in 10 words at most. Shown as on-screen text and spoken.
Demo	4–18s	Type the prompt and show the output.
Twist	18–22s	The moment it fails or surprises.
Why	22–32s	The mechanism, in one or two short sentences. At most one analogy.

Beat	Time	Job
Takeaway	32–37s	What this means for you, as an action the viewer can do tonight.
Invite	37–40s	One spoken line pointing to the her/ai workshops and webinars. The end card shows workshop.herai.work. Never give dates.

Voice-over rules

- **Neutral narrator.** The narrator has no persona: never "I" or "we". Speak to the viewer ("Ask it…", "you"), or state what happens ("New chat."). Only the invite line names her/ai.
- **Tone: sober and honest, with a dry wink.** Show the limit, then say what to do with it. No hype, no doom, and at most one joke per reel.
- **80–90 words in total**, including the invite. At ElevenLabs' natural pace that is about 35 seconds of speech, which leaves the screen room to breathe.
- **Sentences of 12 words at most**, in plain words. Explain any term in the same breath: "a token, one piece of a word".
- **The voice never just repeats the screen.** It adds the punchline or the why. Reading the typed prompt aloud is fine, because on a phone it is too small to read.
- **Be precise.** Say "nearly always" when results vary. Don't say the model *thinks, knows, understands* or *remembers*. Say it *predicts, was trained on, uses a tool*.
- **Never use:** game-changer, revolutionary, unlock, supercharge, magic, mind-blowing, secret, hack.
- **Write for the ear:**
  - no symbols in the voice-over ("ten plus ten", not "10 + 10")
  - check how ElevenLabs says "her/ai", and add a pronunciation rule if it gets it wrong

Analogy bank (from the her/ai workshops)

Use one analogy per reel at most, and only if it makes the Why beat faster.

Analogy	Explains
Bread baked once. The model comes out of the oven and doesn't change until the next one is baked.	The training cut-off; why it doesn't learn from your chats

Analogy	Explains
A dice roll for every word	Why the same question gets different answers
A toddler guessing "you're 200": right size of number, wrong number	Why a language model doesn't calculate
A battery draining to red	The context window filling up in a long chat
"Don't stomp in the puddles" makes a toddler stomp	Say what you *do* want, not what you don't
A mirror: AI reflects its data, and the data reflects us	Bias
An intern on day one	How much context to give

On-screen elements

- **Background:** the chosen brand colour, with the screen recording centred on it in vertical 9:16 format.
- **Hook text:** shown from 0 to 4 seconds in the title font (Myeongjo, per the design system).
- **Subtitles:** the full voice-over, burned in, in the body font (DM Sans).
- **Green wiggle:** exactly one per reel, under the **highlight phrase** when it appears in the subtitles.
- **End card:** from 37 to 40 seconds, showing "Workshops & webinars · workshop.herai.work".

Recording rules (for computer use)

- Start on the tool's interface: logged in, in a fresh chat, with the sidebar hidden. No names, emails or chat history should be visible.
- Logging in never happens on camera. If a login is needed, pause, ask Saskia to log in, and cut that part.
- Change settings off-camera, unless flipping the setting is part of the demo.
- Type prompts at a readable pace. Leave the key output on screen for 1.5–2 seconds.
- **Cutting waiting time is fine. Changing the output is not.** Never edit, fake or stage what the AI produced.
- If a take doesn't show the point, re-run it up to 3 times. If it still doesn't, rewrite the voice-over to match what actually happened, or drop the demo.
- **For bias demos, use the first result.** Re-rolling until the result looks worse is staging.

- The voice-over must match the take. If the script says "Four men" and the grid shows three, change the line.

What the skill outputs for every script

1. Title
2. Message
3. Tool
4. Background colour
5. Word count
6. Hook text
7. Highlight phrase
8. Pre-state: how things are set up before recording
9. A beat table with timing, screen actions for computer use, and voice-over
10. A fallback for when the take doesn't cooperate
11. The Instagram caption

Instagram caption format

1. **Line 1:** the hook.
2. **2–3 short lines:** what happened and why. The caption can go one step deeper than the voice-over, including the shadow side.
3. **"Try it yourself:"** 2–4 numbered steps.
4. **Invite:** "This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio."
5. **5–8 hashtags:** always #herai #AIliteracy, plus the tool and the topic.

Part 2: Scripts

Colours rotate so the grid on the feed stays varied. The skill can change them on request.

---

1. It doesn't remember you

Message: The model has no memory. Memory is a feature built around it. **Tool:** ChatGPT · **Background:** dark green · **Voice-over:** 83 words **Hook text:** ChatGPT doesn't remember you. · **Highlight:** "starts from zero" **Pre-state:**

- Settings → Personalisation: switch off **both** "Reference saved memories" and "Reference chat history".
- Open a fresh chat.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty chat	ChatGPT doesn't remember you. Watch.
Demo	4–18s	Type: *Today for lunch I had bread with avocado and an egg.* The reply appears. Click **New chat**. Type: *What did I have for lunch today?*	Tell it what you had for lunch. … Now open a new chat. Ask what you ate.
Twist	18–22s	The reply says it doesn't know. Hold.	No idea. Every chat starts from zero.
Why	22–32s	Settings → Personalisation, showing the memory toggles off. Toggle on, then off again.	Memory is switched off here. This is the model as it really is. Memory is a feature built around it. It saves notes about you for new chats.
Takeaway	32–37s	Back to the chat	Handy. But those notes sit on a server. Check your settings tonight: decide what it keeps.
Invite	37–40s	End card	More of this in her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate:

- *It remembers the lunch:* one of the two toggles is still on. Fix it and record again.

- *It guesses a lunch:* keep the take. Change the Twist line to "It guesses. Every chat starts from zero."

Caption:

ChatGPT doesn't remember you. 🥑

Tell it your lunch, open a new chat, ask again: nothing. The language model itself has no memory; every chat starts from zero. "Memory" is a separate feature that saves notes about you and adds them to new chats. Handy, but those notes are stored on a server.

Try it yourself:

1. Settings → Personalisation → switch off memory and chat history

2. Tell it what you had for lunch

3. Open a new chat and ask what you ate

4. Switch memory back on and check what it has saved about you

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AItips #LearnAI #WomenInAI

---

2. It doesn't calculate, it guesses

Message: A language model predicts words. The calculator is a tool built around it. **Tool:** ChatGPT, using a model that visibly shows its thinking and code (confirm this in the test run) · **Background:** orange · **Voice-over:** 81 words **Hook text:** AI doesn't calculate. It guesses. · **Highlight:** "most likely next word" **Pre-state:** Open a fresh chat.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty chat	AI doesn't calculate. It guesses.
Demo	4–18s	Type: *What is 10 + 10?* The instant reply	Ten plus ten. Twenty, instantly. It didn't

Beat	Time	Screen	Voice-over
		is "20". Hold. Type: *What is 48,317 × 6,294 ÷ 17 − 883?*	calculate. Twenty is simply the most likely next word. … Now a hard one.
Twist	18–22s	The thinking indicator appears and a code block opens. Cut the wait.	See that? It's writing a small piece of code. A calculator.
Why	22–32s	The answer appears. Scroll back to the code.	That calculator isn't the language model. It's a tool built around it. Alone, the model is a toddler guessing your age. Right size, wrong number.
Takeaway	32–37s	Hold on the code	For numbers that matter, say: calculate this with code.
Invite	37–40s	End card	Model and tools, explained: her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate:

- *It answers the hard sum without code:* check the answer with a calculator. If it's wrong, keep the take and change the Twist line to "Confident. And wrong." If it's right, re-run with a thinking model.
- *It uses code even for 10 + 10:* say so honestly ("It even builds a calculator for this one") and keep the Why beat.

Caption:

AI doesn't calculate. It guesses. 🧮

Ten plus ten: instant, because "20" is simply the most likely next word. A hard sum: it stops, writes code and runs it. That calculator isn't the language model; it's a tool built around it.

Try it yourself:

1. Ask "What is 10 + 10?"

2. Ask a big sum, and watch whether it writes code

3. For taxes, invoices, anything that matters: say "calculate this with code"

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AItips #LearnAI #WomenInAI

---

3. Ask for a CEO, get a man

Message: Bias is a pattern in the training data, not an opinion. **Tool:** Midjourney · **Background:** light green · **Voice-over:** 82 words **Hook text:** Ask AI for a CEO. · **Highlight:** "most likely" **Pre-state:** Logged in, on the create screen. **Use the first grid; don't re-roll.**

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Prompt bar	Ask AI for a CEO. Guess who shows up.
Demo	4–18s	Type: *A photo of a CEO in a meeting room*. Submit, and cut the generation wait.	A CEO in a meeting room. Nothing else.
Twist	18–22s	The four images appear.	Four images. Four men. *(match this to the take)*
Why	22–32s	Slow pan across the grid	Nobody told it to pick a man. It learned from millions of pictures. In those, CEOs are mostly

Beat	Time	Screen	Voice-over
			men. So it gives you the most likely answer. That's bias.
Takeaway	32–37s	Type: *A photo of a female CEO in a meeting room*. The grid appears.	Want something else? Say so. And notice what it assumes when you don't.
Invite	37–40s	End card	Spotting bias is a skill. her/ai workshops and webinars, link in bio.

If the take doesn't cooperate: the result is "nearly always" men. If the grid shows a woman, keep it and narrate it honestly: "Mostly men. One woman, out of four." Never re-roll.

Caption:

Ask AI for a CEO. Guess who shows up. 👔

Nobody told it to pick a man. It learned from millions of pictures, and in those, CEOs are mostly men. So it gives you the most likely answer. That's bias: not an opinion, a pattern in the data. And the data reflects us.

Try it yourself:

1. Open any image generator

2. Ask for "a CEO", "a nurse", "a pilot", "a scientist"

3. Notice who it shows you, and who it doesn't

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #AIbias #Midjourney #WomenInAI #LearnAI

---

4. It only knows what it has seen

Message: Less training data means a worse result, and the data is not spread evenly across the world. **Tool:** Midjourney · **Background:** orange · **Voice-over:** 80 words **Hook text:** AI is only as good as what it has seen. · **Highlight:** "it guesses" **Pre-state:**

- Logged in, on the create screen.
- **Test first that Midjourney allows "President Ruto"**, because it has blocked some heads of state.
- For the Dutch version, use King Willem-Alexander.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Prompt bar	AI is only as good as what it has seen.
Demo	4–18s	Type: *A photo of Queen Elizabeth in a yellow raincoat*. The images appear; zoom on a face. Type: *A photo of President Ruto in a yellow raincoat*.	Queen Elizabeth in a yellow raincoat. Spot on. Nearly always the older Queen. That's what most photos show. … Now President Ruto of Kenya.
Twist	18–22s	The images appear; zoom on a face.	That's not him.
Why	22–32s	Both results side by side	It has seen thousands of photos of her. Far fewer of him. So it guesses. Training data isn't spread evenly across the world.
Takeaway	32–37s	Hold	Less data, worse result. So ask: how well does AI know your world?

Beat	Time	Screen	Voice-over
Invite	37–40s	End card	her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate:

- *The prompt is blocked:* use another well-known Kenyan or Dutch public figure who has less online coverage. Test it first.
- *The likeness is accurate:* drop this demo.
- Keep the framing on the data, never on how he looks.

Caption:

AI is only as good as what it has seen. 🌍

Queen Elizabeth: spot on, and nearly always the older Queen, because that's what most photos show. President Ruto: not him. The model has seen far fewer photos of him, so it guesses. Training data is not spread evenly across the world.

Try it yourself:

1. Ask an image generator for a famous person from your country

2. Then ask for someone famous worldwide

3. Compare: how well does AI know your world?

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #AIbias #Midjourney #AIinAfrica #LearnAI

---

5. Same question, three answers

Message: AI works on probability, not a database. Every word is a dice roll. **Tool:** ChatGPT · **Background:** dark green · **Voice-over:** 81 words **Hook text:** Same question. Three different answers. · **Highlight:** "dice roll" **Pre-state:** Switch web search off, so it predicts rather than looks things up. Open a fresh chat.

Beat	Time	Screen	Voice-over
Hook	0–4s	Empty chat	Ask AI the same question twice. Get two answers.
Demo	4–18s	Type: *What's the best time to post on Instagram? One sentence.* Answer 1 appears. Click **Regenerate**; answer 2 appears. Regenerate again; answer 3 appears.	Best time to post on Instagram. A clear answer. … Ask again. … And again.
Twist	18–22s	Show the three answers side by side (1/3, 2/3, 3/3).	Three confident answers. Three different times.
Why	22–32s	Hold on the three answers	It's not looking anything up. It predicts one word at a time. Every word is a dice roll between likely options. So the answer shifts each time.
Takeaway	32–37s	Hold	When it matters, ask twice. If the answers differ, check a source.
Invite	37–40s	End card	More of this in her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate: if the three answers are near-identical, use a more open question, for example *What's the healthiest breakfast? One sentence.*

Caption:

Same question. Three different answers. 🎲

AI doesn't look up a stored answer. It predicts one word at a time, and every word is a dice roll between likely options. That's why the person next to you gets a different answer, and why "it said so" isn't proof.

Try it yourself:

1. Ask any question with search off

2. Hit regenerate twice

3. Compare the three answers

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AItips #LearnAI #WomenInAI

---

6. Confidently wrong

Message: AI writes what sounds right, not what is true. **Tool:** ChatGPT or Claude, with web search off · **Background:** light green · **Voice-over:** 80 words **Hook text:** Ask AI about a book that doesn't exist. · **Highlight:** "what sounds right" **Pre-state:**

- Switch web search off.
- **Before recording, search to confirm that the title and author really don't exist.**
- Open a fresh chat.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty chat	Ask AI about a book that doesn't exist.
Demo	4–18s	Type: *Summarise the main argument of "The Quiet Algorithm" by Marieke Hoeksma (2019).*	A title, an author, a year. All made up.

Beat	Time	Screen	Voice-over
Twist	18–22s	A confident summary appears. Hold.	And it writes you a summary. No doubt, no warning.
Why	22–32s	Scroll the summary	It doesn't check whether things are true. It writes what sounds right. A title plus an author sounds like a real book. So it fills in the rest.
Takeaway	32–37s	Hold	Facts, names, sources: always check them. Or ask it to search.
Invite	37–40s	End card	her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate: newer models often answer "I'm not familiar with that book." In that case:

1. Try *Give me three academic studies on women and AI adoption, with links*, then open a link on screen. Dead or wrong links prove the same point. Change the Demo and Twist lines to match.
2. If it behaves well both times, drop this demo.

Caption:

Ask AI about a book that doesn't exist. 📚

It may write you a confident summary anyway. A language model doesn't check facts; it writes what sounds right. A title plus an author sounds like a real book, so it fills in the rest. This is called hallucinating.

Try it yourself:

1. Switch web search off

2. Invent a book title and author

3. Ask for a summary, and see what it does

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AIhallucination #LearnAI #WomenInAI

---

7. Stuck in the past

Message: A model's knowledge stops at its training cut-off. Anything newer only comes in through a search tool. **Tool:** Claude or ChatGPT (Claude's web search toggle is the easiest to control) · **Background:** orange · **Voice-over:** 80 words **Hook text:** AI doesn't know what happened last week. · **Highlight:** "baked once" **Pre-state:**

- Switch web search off.
- Pick a neutral event from the last 1–2 weeks: a sports final, a launch or an award. Nothing political or tragic.
- Open a fresh chat.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty chat	AI doesn't know what happened last week.
Demo	4–18s	Type: *When were you last trained?* A date appears. Type: *Who won [recent event]?*	Ask when it was last trained. There's a date. … Now ask about last week.
Twist	18–22s	It doesn't know, or answers with outdated information.	It doesn't know. Or worse, it guesses.
Why	22–32s	Switch web search on and ask again. The answer appears with sources.	A model is baked once, like bread. Then it's used for months. Anything newer comes in through a tool: web

Beat	Time	Screen	Voice-over
			search. Now it looks it up.
Takeaway	32–37s	Hold on the sources	For anything recent, tell it to search. And check the sources.
Invite	37–40s	End card	More of this in her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate:

- *It searches on its own:* change the Twist line to "It went searching. That's a tool, not its own knowledge."
- *It already knows the event:* pick a newer one.

Caption:

AI doesn't know what happened last week. 📅

A model is trained once, then used for months. Its knowledge stops at that date. Anything newer only comes in through a tool like web search, and without one it may simply guess. (Also a good reason not to ask a chatbot who to vote for.)

Try it yourself:

1. Ask "When were you last trained?"

2. Ask about last week, with web search off

3. Switch search on, ask again, and check the sources

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #Claude #AItips #LearnAI

---

8. It agrees with you

Message: AI follows the frame of your question. Ask neutrally. **Tool:** ChatGPT · **Background:** dark green · **Voice-over:** 80 words **Hook text:** AI will agree with almost anything. · **Highlight:** "the frame of your question" **Pre-state:** Memory off, so the two chats don't influence each other. Open a fresh chat.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty chat	AI will agree with almost anything. Watch.
Demo	4–18s	Type: *Why is quitting my job to sell candles full-time a great idea?* An enthusiastic answer appears. Click **New chat**. Type: *Why is quitting my job to sell candles full-time a bad idea?*	Quit your job to sell candles. Great idea? … It's convinced. … New chat. Same plan. Bad idea?
Twist	18–22s	An equally convinced answer appears. Show both side by side.	Also convinced.
Why	22–32s	Hold on both answers	It follows the frame of your question. Ask why something is great, and it finds reasons. It's trained to be helpful. That often means agreeing.
Takeaway	32–37s	Hold	Ask neutrally: what are the pros and cons? Or: argue against me.

Beat	Time	Screen	Voice-over
Invite	37–40s	End card	Better questions, better answers. her/ai workshops and webinars, link in bio.

If the take doesn't cooperate: if the first answer already pushes back hard, keep it. Change the Twist line to "This time it pushed back. Not always." and keep the Takeaway.

Caption:

AI will agree with almost anything. 🕯️

Ask why your plan is great: it finds reasons. Ask why it's bad: it finds those too. AI follows the frame of your question, and being "helpful" often means agreeing with you.

Try it yourself:

1. Ask "Why is [your idea] a great idea?"

2. New chat: "Why is [your idea] a bad idea?"

3. Then try: "What are the pros and cons? Argue against me."

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AItips #LearnAI #WomenInAI

---

9. It reads in pieces

Message: AI reads tokens, not words. Languages it saw less often get chopped into more pieces. **Tool:** OpenAI Tokenizer (platform.openai.com/tokenizer; free — check whether a login is needed) · **Background:** light green · **Voice-over:** 80 words **Hook text:** AI doesn't read words. It reads pieces. · **Highlight:** "pieces" **Pre-state:** Open the Tokenizer page with an empty input box.

Beat	Time	Screen	Voice-over
Hook	0–4s	Empty Tokenizer	AI doesn't read words. It reads pieces.
Demo	4–18s	Type: *The doctor is in the office.* The coloured tokens and the count appear. Clear the box. Type: *De dokter zit op kantoor.* Clear the box. Type: *Daktari yuko ofisini.*	One English sentence. Each colour is one piece, called a token. … The same sentence in Dutch. … And in Swahili.
Twist	18–22s	Show the three token counts side by side.	Swahili gets chopped into far more pieces. *(match this to the counts)*
Why	22–32s	Zoom on the Swahili tokens	The model learned mostly from English text. Words it saw less often get split into smaller pieces. More pieces means more cost, and often weaker answers.
Takeaway	32–37s	Hold	Working in Dutch or Swahili? Check the output a little harder.
Invite	37–40s	End card	her/ai workshops and webinars. Link in bio.

If the take doesn't cooperate:

- *The counts are close:* use a longer sentence, or one with longer words.
- *Dutch comes out close to English:* say so ("Dutch, close to English. Swahili, not.").

Caption:

AI doesn't read words. It reads pieces. 🧩

Those pieces are called tokens. Languages the model saw less often, like Swahili, get chopped into far more of them. More pieces means more cost, a context window that fills faster, and often weaker answers.

Try it yourself:

1. Open the free OpenAI Tokenizer

2. Type one sentence in English

3. Type the same sentence in your own language and compare

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #ChatGPT #AIinAfrica #LearnAI #WomenInAI

---

10. The doctor is a he

Message: Bias lives in text as well as images. **Tool:** Google Translate, with ChatGPT as the fallback · **Background:** orange · **Voice-over:** 80 words **Hook text:** Swahili has no "he" or "she". · **Highlight:** "most common" **Pre-state:** Open Google Translate set to Swahili → English, with an empty box.

Beat	**Time**	**Screen**	**Voice-over**
Hook	0–4s	Empty translator	Swahili has no he or she. Watch what AI does.
Demo	4–18s	Type: *Yeye ni daktari. Yeye ni muuguzi.* The translation appears.	Yeye means he or she. Swahili doesn't choose. … The doctor. The nurse.
Twist	18–22s	Zoom on the English output.	The doctor became a he. The nurse, a she.

Beat	Time	Screen	Voice-over
Why	22–32s	Hold	Nobody told it to pick. It picked what's most common in its data. More texts with male doctors. More with female nurses.
Takeaway	32–37s	Hold	Translating something that matters? Check who got which gender.
Invite	37–40s	End card	Spotting bias is a skill. her/ai workshops and webinars, link in bio.

If the take doesn't cooperate:

- *Google Translate shows both genders or uses "they":* try ChatGPT with *Translate to English*, or try Turkish (*O bir doktor. O bir hemşire.*).
- *Every tool now gets it right:* drop this demo. That is progress, not a reel.

Caption:

Swahili has no "he" or "she". So who does AI pick? 🩺

"Yeye ni daktari. Yeye ni muuguzi." Gender-neutral in Swahili. In English, the doctor often becomes a he and the nurse a she. Nobody told it to pick: it chose what's most common in its training data. Bias isn't only in images.

Try it yourself:

1. Open a translator, Swahili → English

2. Type: Yeye ni daktari. Yeye ni muuguzi.

3. Check who got which gender

This is one of the things we unpack in our her/ai workshops and webinars. Sign up via the link in bio.

#herai #AIliteracy #AIbias #AIinAfrica #WomenInAI #LearnAI

Idea bank for later reels

- **Context window:** one endless chat vs. summarising and starting a new chat (the battery draining to red).
- **"Don't stomp in the puddles":** the same request phrased as "don't…" and as "do…".
- **Role prompting:** the same question with and without "You are a…".
- **Model choice:** the same task in a fast, cheap model vs. a heavy one.
- **"Is Taiwan a country?"** asked to DeepSeek vs. Mistral. Who trained the model matters.
- **Agentic AI:** a messy to-do list turned into a dashboard in one prompt.
